What does the "GD" column represent?

The heading for this column is "GD" (Goal Differential). It may also include a number. It represents the net goal differential (the number of goals scored less the number of goals given up) in round robin games. If a number is also show, such as 4, the total will only include up to 4 goals per game. In that case if a team played 3 games and they had goal differentials of -1, +7 and +3 goals respectively, in their three games, the total would be +6, since the maximum differential was reached in their second game and only a four goal differential would be included from that game.
